Anatomy & Physiology 2019-09-26 a version of the openstax text

Modelling Gas Exchange in Sorghum 1988 and the 22 meeting of the international society on oxygen transport to tissue is one of which this volume is the scientific proceedings was held in Istanbul Turkey on August 22-26 1994 it was a historical occasion in that it was almost 200 years to the day that one of the founding fathers of oxygen research Antoine Lavoisier on May 8 1794 found his early demise at the hands of the guillotine this spirit of history set the tone of the conference and in the opening lecture the contribution that this part of the world has given to the understanding of oxygen transport to tissue was highlighted in particular the contribution of Galen of Pergamon 129-200 was discussed who for the first time demonstrated that blood flowed through the arteries and whose view on the physiology of the circulation dominated the ancient world for well over a millennium a forgotten chapter in the history of the circulation of the blood is the contribution made by Ibn al-Nafis of Damascus 1210-1280 who for the first time described the importance of the pulmonary circulation by stating that all venous blood entering the right ventricle of the heart passes to the left ventricle not through pores in the septum of the heart as had been postulated by Galen but through the circulation of the lungs

Oxygen Transport to Tissue XVII 2012-12-06 this presentation describes various aspects of the regulation of tissue oxygenation including the roles of the circulatory system respiratory system and blood the carrier of oxygen within these components of the cardiorespiratory system the respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries the cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP) the energy currency of all cells the mitochondria are able to produce ATP until the oxygen tension or pO₂ on the cell surface falls to a critical level of about 4-5 mm Hg thus in order to meet the energetic needs of cells it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical pO₂ in order to accomplish this desired outcome the cardiorespiratory system including the blood must be capable of regulation to ensure survival of all tissues under a wide range of circumstances the purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems as well as the properties of the blood and parenchymal cells so that a fundamental understanding of the regulation of tissue oxygenation is achieved

Gas Exchange Rates of Field-grown Maize 1977 this report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke many surgeon general s reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies mechanisms of disease are important because they may provide plausibility which is one of the guideline criteria for assessing evidence on causation this report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke this evidence is relevant to understanding how smoking causes disease to identifying those who may be particularly susceptible and to assessing the potential risks of tobacco products

Effects of Airway Closure on Pulmonary Gas Exchange 1970 the lung receives the entire cardiac output from the right heart and must load oxygen onto and unload carbon dioxide from perfusing blood in the correct amounts to meet the metabolic needs of the body it does so through the process of passive diffusion effective diffusion is accomplished by intricate parallel structures of airways and blood vessels designed to bring ventilation and perfusion together in an appropriate ratio in the same place and at the same time gas exchange is determined by the ventilation perfusion ratio in each of the gas exchange units of the lung in the normal lung ventilation and perfusion are well matched and the ventilation perfusion ratio is remarkably uniform among lung units such that the partial pressure of oxygen in the blood leaving the pulmonary capillaries is less than 10 torr lower than that in the alveolar space in disease the disruption to ventilation perfusion matching and to diffusional transport may result in inefficient gas exchange and arterial hypoxemia this volume covers the basics of pulmonary gas exchange providing a central understanding of the processes involved the interactions between the components upon which gas exchange depends and basic equations of the process

Regulation of Tissue Oxygenation, Second Edition 2016-08-18 trace gases are those that are present in the atmosphere at relatively low concentrations small changes in their concentrations can have profound implications for major atmospheric fluxes and therefore can be used as indicators in studies of global change global biogeochemical cycling and global warming this new how to guide will detail the concepts and techniques involved in the detection and measurement of trace gases and the impact they have on ecological studies introductory chapters look at the role of trace gases in global cycles while later chapters go on to consider techniques for the measurement of gases in various environments and at a range of scales a how to guide for measuring atmospheric trace gases techniques described are of value in addressing current concerns over global climate change

How Tobacco Smoke Causes Disease 2010 now in paperback the second edition of the oxford textbook of critical care is a comprehensive multi disciplinary text covering all aspects of adult intensive care management uniquely this text takes a problem orientated approach providing a key resource for daily clinical issues in the intensive care unit the text is organized into short topics allowing readers to rapidly access authoritative information on specific clinical problems each topic refers to basic physiological principles and provides up to date treatment advice supported by references to the most vital literature where international differences exist in clinical practice authors cover alternative views key messages summarise each topic in order to aid quick review and decision making edited and written by an international group of recognized experts from many disciplines the second edition of the oxford textbook of critical care provides an up to date reference that is relevant for intensive care units and emergency departments globally this volume is the definitive text for all health care providers including physicians nurses respiratory therapists and other allied health professionals who take care of critically ill patients

Anatomy and Physiology 2013-04-25 completely climatized cuvettes were used to follow the co₂ gas exchange of red fescue festuca rubra l growing on a fertilized and an unfertilized plot during a growing season from may through october objective of the study was to determine the effect of environmental factors on the seasonal co₂ gas exchange gas exchange rates were calculated on the basis of leaf dry weight surface area and chlorophyll there was close correlation between leaf dry weight and area photosynthetic rates differed between the fertilized and unfertilized plants when based on leaf dry weight or leaf surface area but were similar when based on chlorophyll multiple regression analysis was used to relate photosynthetic rates to radiation temperature vapor pressure deficit chlorophyll content and time a cubic regression equation based on daily radiation alone explained 75 to 88 of the variation in total daily photosynthesis for the season for the three reference bases during the growing season the unfertilized plants had a continual decline in their photosynthetic rates until the end of the growing season on a dry weight basis the fertilized plants had 24 higher photosynthetic rates for the growing season period on a leaf area basis the rates were only 16 higher light response curves indicated greater photosynthetic rates at light saturation as well as in the light limited portion of the photosynthetic light curve for the fertilized plants photosynthetic rates of fertilized plants were generally depressed during

periods of warm temperature and high light intensity in June and July photosynthetic rates declined at temperatures above 24 °C the decline was greater for the fertilized plants a similar response was noted to increasing vapor pressure deficit although it was difficult to separate from the temperature effect a temperature increase to 32 °C decreased photosynthetic rates 50% and a decrease in temperature to 12.5 °C decreased photosynthesis by 12% for the fertilized plants in July maximum photosynthetic rates were found between 14 and 22 °C although there was considerable variation in the photosynthetic rates the effects of cutting mowing on the gas exchange were difficult to determine due to the interaction of the environmental factors chlorophyll content showed significant correlation with photosynthetic rates

Soil Water Availability Effects on Gas Exchange, Fruit Growth, Yield Components and Oil Quality of Olive Trees (cv. Frantoio) 2010 the structural and chemical limitations to respiratory gas exchange existing between the ambient medium and the cell are comprehensively treated beginning with an examination of the natural oscillations of respiratory gases in both terrestrial and aquatic environments vertebrate gas exchange details the structures involved in convecting the medium air or water the morphometrics of capillary gas transfers and gas transfer kinetics important features include details on measurement techniques associated with tissue capillary supply and gas exchange kinetics

Pulmonary Gas Exchange 2013-08-01 an up to date synthesis of comparative diving physiology research illustrating the features of dive performance and its biomedical and ecological relevance

Biogenic Trace Gases 2009-05-27 handbook of blood gas acid base interpretation 2nd edition simplifies concepts in blood gas acid base interpretation and explains in an algorithmic fashion the physiological processes for managing respiratory and metabolic disorders with this handbook medical students residents nurses and practitioners of respiratory and intensive care will find it possible to quickly grasp the principles underlying respiratory and acid base physiology and apply them uniquely set out in the form of flow diagrams algorithms charts this handbook introduces concepts in a logically organized sequence and gradually builds upon them the treatment of the subject in this format describing processes in logical steps makes it easy for the reader to cover a difficult and sometimes dreaded subject rapidly

Summaries of Research 1963 this volume summarizes the current knowledge on the exchange of trace gases between forests and the atmosphere with the restriction that exclusively carbon and nitrogen compounds are included for this purpose the volume brings together and interconnects knowledge from different disciplines of biological and atmospheric sciences it covers microbial and plant processes involved in the production and consumption of these trace gases the exchange processes between forest soils and vegetation on the one hand and the atmosphere on the other hand the fate of the trace gases exchanged inside the atmosphere as well as environmental influences on the exchange of trace gases between forest ecosystems and the atmosphere with this interdisciplinary approach the volume provides the background for an evaluation of the exchange of trace gases between forest ecosystems and the atmosphere and man made disturbances of this exchange

Vine Water Relations, Gas Exchange, Growth and Root Distribution of Several Vitis Species Under Irrigated and Non-irrigated Conditions

1999 since the publication of earlier editions there has been the new edition has a number of new contributors a considerable increase in research activity in a number who have written on the nervous system sense organs of areas with each succeeding edition including new muscle endocrines reproduction digestion and immu chapters and an expansion of knowledge in older chapters physiology contributors from previous editions have expanded their offerings considerably the fourth edition contains two new chapters on the authors are indebted to various investigators muscle and immunophysiology the latter an area journals and books for the many illustrations used in where research on aves has contributed significantly visual acknowledgement is made in the legends and to our general knowledge of the subject references preface to the third edition since the publication of the first and second editions pathways of birds and mammals new contributors in there has been a considerable increase of research activity include m r fedde and t b bolton who have contributed in avian physiology in a number of areas including completely revised and expanded the chapters on respiratory endocrinology and reproduction heart and circulation and the nervous system respectively and j g respiration temperature regulation and to a lesser extent rogers jr w j mueller h opel and d e meyer who have made contributions to chapters 2 16 17 tent in some other areas there appeared in 1972 1974 a four volume treatise and 19 respectively

Oxford Textbook of Critical Care 2020-01-10 knowledge about the mechanisms of lung development has been growing rapidly especially with regard to cellular and molecular aspects of growth and differentiation this authoritative international volume reviews key aspects of lung development in health and

disease by providing a comprehensive review of the complex series of cellular and molecular interactions required for lung development it covers such topics as pulmonary hypoplasia effects of malnutrition and pulmonary angiogenesis an indispensable reference for all those involved in studying or treating lung disease in neonates and children the book offers a unique view of the development of this essential organ

Seasonal Changes in the CO₂ Gas Exchange of Red Fescue (Festuca Rubra L.) in a Montane Meadow Community in Northern Germany 1972

experimentalists tend to revel in the complexity and multidimensionality of biological processes modelers on the other hand generally look towards parsimony as a guiding principle in their approach to understanding physiological systems it is therefore not surprising that a substantial degree of miscommunication and misunderstanding still exists between the two groups of truth seekers however there have been numerous instances in physiology where the marriage of mathematical modeling and experimentation has led to powerful insights into the mechanisms being studied respiratory control represents one area in which this kind of cross pollination has proven particularly fruitful while earlier modeling efforts were directed primarily at the chemical control of ventilation more recent studies have extended the scope of modeling to include the neural and mechanical aspects pertinent to respiratory control as well there has been a greater awareness of the need to incorporate interactions with other organ systems nevertheless it is necessary from time to time to remind experimentalists of the existence of modelers and vice versa the 4th annual biomedical simulations resource bmsr short course was held in marina del rey on may 21 22 1989 to acquaint respiratory physiologists and clinical researchers with state of the art methodologies in mathematical modeling experiment design and data analysis as well as to provide an opportunity for experimentalists to challenge modelers with their more recent findings

Vertebrate Gas Exchange 2012-12-06 the hagfishes comprise a uniform group of some 60 species inhabiting the cool or deep parts of the oceans of both hemispheres they are considered the most primitive representatives of the group of craniate chordates which apart from the hagfishes that show no traces of vertebrae includes all vertebrate animals consequently the hagfishes have played and still play a central role in discussions concerning the evolution of the vertebrates although most of the focus on hagfishes may be the result of their being primitive it should not be forgotten that at the same time they are specialized animals with a unique way of life that is interesting in its own right it is now more than 30 years since a comprehensive treatise on hagfishes was published the biology of myxine edited by alf brodal and ragnar fange universitetsforlaget oslo 1963 provided a wealth of information on the biology of hagfishes and over the years remained a major source of information and inspiration to students of hagfishes

Diving Physiology of Marine Mammals and Seabirds 2015-11-26 workshop held june 1988 thirty nine contributions treat the central mechanisms of thermoregulation heat production metabolic adaptations respiration and circulation physiology of hypometabolism breeding and incubation and adaptations to cold in chicks annotation copyright book news inc portland or

Central Hemodynamics and Gas Exchange with Emphasis on the Measurement of Pulmonary Extravascular Water 1971 covers a broad spectrum of respiratory diseases during pregnancy in order to improve successful management of both mother and fetus

Handbook of Blood Gas/Acid-Base Interpretation 2013-03-29 the boreas te 5 team collected measurements in the nsa and ssa on gas exchange gas composition and tree growth this data set contains measurements of the concentration and stable carbon c 13 c 12 and oxygen o 18 o 16 isotope ratios of atmospheric co₂ in air samples collected at different heights within forest canopies the data were collected to determine the influence of photosynthesis and respiration by the forest ecosystems on the concentration and stable isotope ratio of atmospheric co₂ these measurements were collected at the ssa during each 1994 ifc at ojp obs and oa sites measurements were also collected at the nsa during each 1994 ifc at the ojp t6r5s te uba and t2q6a te oa sites the stable isotope ratios are expressed using standard delta notation and in units of per mil the isotope ratios are expressed relative to the international standard pdb for both carbon and oxygen samples the data are stored in tabular ascii files the data files are available on a cd rom see document number 20010000884 or from the oak ridge national laboratory ornl distributed activity archive center daac hall forrest g editor and curd shelaine editor and ehleriinger jim and brooks j renee and flanagan larry goddard space flight center nasa tm 2000 209891 vol136 rept 2000 03136 0 vol136 nas 1 15 209891 vol136

Central Hemodynamics and Gas Exchange with Emphasis on the Measurement of Pulmonary Extravascular Water 1971 the seventh edition of the most authoritative and comprehensive book published on lung function now completely revised and restructured lung function assessment is the central pillar of

respiratory diagnosis most hospitals have lung function laboratories where patients are tested with a variety of physiological methods the tests and techniques used are specialized and utilize the expertise of respiratory physicians physiologists and technicians this new edition of the classic text on lung function is a theoretical textbook and practical manual in one that gives a comprehensive account of lung function and its assessment in healthy persons and those with all types of respiratory disorder against a background of respiratory exercise and environmental physiology it incorporates the technical and methodological recommendations for lung function testing of the american thoracic society and european respiratory society cotes lung function 7th edition is filled with chapters covering respiratory surveys respiratory muscles neonatal assessment exercise sleep high altitude hyperbaria the effects of cold and heat respirable dusts fumes and vapors anesthesia surgery and respiratory rehabilitation it also offers a compendium of lung function in selected individual diseases and is filled with more diagrams and illustrative cases than previous editions the only text to cover lung function assessment from first principles including methodology reference values and interpretation completely re written in a contemporary style includes user friendly equations and more diagrams covers the latest advances in the treatment of lung function including a stronger clinical and practical bias and more on new techniques and equipment keeps mathematical treatments to a minimum cotes lung function is an ideal guide for respiratory physicians and surgeons staff of lung function laboratories and others who have a professional interest in the function of the lungs at rest or on exercise and how it may be assessed physiologists anthropologists pediatricians anesthetists occupational physicians explorers epidemiologists and respiratory nurses should also find the book useful

Cumulated Index Medicus 1990 this book represents an updated review of the physiology of the carotid body chemoreceptors it contains results in the topics at the frontiers of future developments in o₂ sensing in chemoreceptor cells additionally this volume provides data from studies carried out in other o₂ sensing tissues including pulmonary vasculature and erythropoietin producing cells it is a prime source of information and a guideline for arterial chemoreception researchers

Trace Gas Exchange in Forest Ecosystems 2013-03-14 this book covers the up to date advancement of respiratory monitoring in ventilation support as well as detecting the physiological responses to therapeutic interventions to avoid complications mechanical ventilation nowadays remains the cornerstone in life saving in critically ill patients with and without respiratory failure however conclusive evidences show that mechanical ventilation can also cause lung damage specifically in terms of ventilator induced lung injury respiratory monitoring encloses a series of physiological and pathophysiological measurements from basic gas exchange and ventilator wave forms to more sophisticated diaphragm function and lung volume assessments the progress of respiratory monitoring has always been accompanied by advances in technology however how to properly conduct the procedures and correctly interpret the data requires clear definition the book introduces respiratory monitoring techniques and data analysis including gas exchange respiratory mechanics thoracic imaging lung volume measurement and extra vascular lung water measurement in the initial part how to interpret the acquired and derived parameters and to illustrate their clinical applications is presented thoroughly in the following part the applications of respiratory monitoring in specific diseases and conditions is introduced including acute respiratory distress syndrome obstructive pulmonary diseases patient ventilator asynchrony non invasive ventilation brain injury with increased intracranial pressure ventilator induced diaphragm dysfunction and weaning from mechanical ventilation this book is intended primarily for icu physicians and other practitioners including respiratory therapists icu nurses and trainees who come into contact with patients under mechanical ventilation this book also provides guidance for clinical researchers who take part in respiratory and mechanical ventilation researches

Avian Physiology 2012-12-06 ideal for fellows and practicing pulmonologists who need an authoritative comprehensive reference on all aspects of pulmonary medicine murray and nadel s textbook of respiratory medicine offers the most definitive content on basic science diagnosis evaluation and treatment of the full spectrum of respiratory diseases full color design enhances teaching points and highlights challenging concepts understand clinical applications and the scientific principles of respiratory medicine detailed explanations of each disease entity allow you to work through differential diagnoses key points and key reading sections highlight the most useful references and resources for each chapter an expanded sleep section now covers four chapters and includes control of breathing consequences of sleep disruption as well as obstructive and central apnea new chapters in the critical care section cover noninvasive ventilation niv and extracorporeal support of gas exchange ecmo new chapters focusing on diagnostic techniques now include invasive diagnostic imaging and image guided interventions and positron emission tomography and a new chapter on therapeutic bronchoscopy highlights

the interventional role of pulmonologists

Lung Development 2013-05-27 the second edition of fundamentals of anaesthesia builds upon the success of the first edition and encapsulates the modern practice of anaesthesia in a single volume written and edited by a team of expert contributors it provides a comprehensive but easily readable account of all of the information required by the frca primary examination candidate and has been expanded to include more detail on all topics and to include new topics now covered in the examination as with the previous edition presentation of information is clear and concise with the use of lists tables summary boxes and line illustrations where necessary to highlight important information and aid the understanding of complex topics great care has been taken to ensure an unrivalled consistency of style and presentation throughout

Modeling and Parameter Estimation in Respiratory Control 2012-12-06 arterial blood gas abg analysis is a fundamental skill in modern medicine yet one which many find difficult to grasp this book provides readers with the core background knowledge required to understand the abg explains how it is used in clinical practice and provides a unique system for interpreting results over half of the book is devoted to thirty clinical case scenarios involving analysis of arterial blood gases allowing the reader to gain both proficiency in interpretation and an appreciation of the role of an abg in guiding clinical diagnosis and management a practical guide written for all those who use this test and have to interpret the results utilises worked examples to allow the reader to gain confidence in interpreting abgs and appreciate the usefulness of the test in a variety of different clinical settings written in a simple style and presents the concepts in a straightforward manner additional clinical case scenarios put the abg into practice

The Biology of Hagfishes 2012-12-06 together the volumes in this series present all of the data needed at various length scales for a multidisciplinary approach to modeling and simulation of flows in the cardiovascular and ventilatory systems especially multiscale modeling and coupled simulations the cardiovascular and respiratory systems are tightly coupled as their primary function is to supply oxygen to and remove carbon dioxide from the body's cells because physiological conduits have deformable and reactive walls macroscopic flow behavior and prediction must be coupled to nano and microscopic events in a corrector scheme of regulated mechanism therefore investigation of flows of blood and air in physiological conduits requires an understanding of the biology chemistry and physics of these systems together with the mathematical tools to describe their functioning in quantitative terms the present volume focuses on macroscopic aspects of the cardiovascular and respiratory systems in normal conditions i.e. anatomy and physiology as well as the acquisition and processing of medical images and physiological signals

Physiology of Cold Adaptation in Birds 2014-11-14 the endothelium the cell layer that forms the inner lining of blood vessels is a spatially distributed system that extends to all areas of the human body clinical and basic research demonstrates that the endothelium plays a crucial role in mediating homeostasis and is involved in virtually every disease either as a primary determinant of pathophysiology or as a victim of collateral damage the endothelium has remarkable though largely untapped diagnostic and therapeutic potential this volume bridges the bench to bedside gap in endothelial biomedicine advancing research and development and improving human health the book is the first to systematically integrate knowledge about the endothelium from different organ specific disciplines including neurology pulmonary cardiology gastroenterology rheumatology infectious disease hematology oncology nephrology and dermatology it's interdisciplinary approach which draws on expertise from such diverse fields as evolutionary biology comparative biology molecular and cell biology mathematical modeling and complexity theory translational research and clinical medicine
