artificial neural networks are widely used as flexible models for classification and regression applications but questions remain about how the power of these models can be safely exploited when training data is limited this book demonstrates how bayesian methods allow complex neural network models to be used without fear of the overfitting that can occur with traditional training methods insight into the nature of these complex bayesian models is provided by a theoretical investigation of the priors over functions that underlie them a practical implementation of bayesian neural network learning using markov chain monte carlo methods is also described and software for it is freely available over the internet presupposing only basic knowledge of probability and statistics this book should be of interest to researchers in statistics engineering and artificial intelligence

a software agent has a spectrum of definitions at one end of the scale are relatively simple client based software applications that can assist users in performing mundane tasks such as sorting e mail or downloading web pages this class of agents is often referred to as personal assistant agents at the other end of the scale is the concept of sophisticated software entities possessing artificial intelligence that autonomously travel through a network environment and make complex decisions on a user s behalf in telecommunications the definition lies somewhere between those two extremes this classification of mobile agents although not strictly adhering to the definition of intelligent agents originally proposed by the artificial intelligence community is generally acknowledged to be a useful categorization and has started to gain widespread acceptance we therefore define a mobile agent as a program that acts on behalf of a user or another program and is able to migrate from host to host on a network under its own control the agent chooses when and where it will migrate and may interrupt its own execution and continue elsewhere on the network the agent returns results and messages in an asynchronous fashion this volume discusses the emerging field of mobile software agents and their applications to the area of telecommunications such as active networks e commerce the internet interactive qos network management and feature interactions it addresses the needs of a wide audience including researchers software agent systems and telecommunication applications designers and users of software agents
