Harnessing Renewable Energy in Electric Power Systems 2010

reflecting its reliance on fossil fuels the electric power industry produces the majority of the world s greenhouse gas emissions the need for a revolution in the industry becomes further apparent given that decarbonization means an increasing electrification of other sectors of the economy in particular through a switch from gasoline to electric vehicles of the options for producing electric power without significant greenhouse gas emissions renewable energy is most attractive to policymakers as it promises increased national self reliance on energy supplies and the creation of new industries and jobs without the safety and political concerns of nuclear power or the unproven technology of carbon capture and storage drawing on both economic theory and the experiences of the united states and eu member states harnessing renewable energy addresses the key questions surrounding renewable energy policies how appropriate is the focus on renewable power as a primary tool for reducing greenhouse gas emissions if renewable energy is given specific support what form should that support take what

are the implications for power markets if renewable generation is widely adopted thorough and well evidenced this book will be of interest to a broad range of policymakers the electric power industry and economists who study energy and environmental issues

Small-Scale Renewable Energy Systems 2019-10-16

a revolution is ongoing in the field of small scale energy solutions which can enable lower impact on the environment more robust supply and self determination solar power and other forms of renewable energy sources which you can implement to generate your own electricity are growing quickly electromobility is transforming the car industry and transportation systems and can also play a role in your energy system electricity can be used much more efficiently than before for example by using led light variable speed motor drives and efficient home appliances smart controls are available sometimes with free open source software all this opens up tremendous opportunities for energy independence which is the focus of this book the book introduces the reader to a number of renewable energy sources to different options for storing electricity and to smart use of electricity particularly in the context of small isolated systems this is important because many renewable energy sources are weather and season dependent and usually require storage and smart control in order to obtain a system that is completely independent of the electricity grid in the book overall system design is explained including how to combine different sources in a hybrid system different system sizes and architectures are also covered a number of real cases are described where homes businesses and communities have achieved a high level of energy independence or are on their way to achieving it this book will prove useful in university education in renewable energy at bachelor and master level and also for companies and private individuals who want to start or expand activities in the area of renewable energy

Focus on Renewable Energy Sources 2018

energy is one of the main determinants of economic growth but the high dependence of electricity production by fossil fuels could be a brake for the development of countries which do not have a sufficient level of richness and or which possess a high level of environmental sensitivity countries tend to contrast these limits to growth using a higher percentage of renewable sources for electricity generation though the technological limits still suffer renewable energy sources are appreciated worldwide for their ability to limit significantly the impact of anthropic activities on energy production and counter the gradual appreciation of the raw materials used in the process of traditional generation based on gas and or oil power plants moreover renewable generation can encourage off grid generation in the underdeveloped countries the attention to environmental issues has led several countries to ratify international agreements such as the kyoto protocol durban protocol and more recently the paris agreement these mandates pledge to reduce emissions of pollutants and to increase the share of energy produced through the use of renewable sources but the results obtained so far are not encouraging the relevance of the renewable energy generation and the increase in the investments in a newly installed capacity lead many scholars to investigate the relationship between economic growth and the key factors of the investments in res with this volume the authors want to explore and analyze the causes and consequences of fragmentation and discussing policy responses on promoting renewable energy generation by shedding light on the policies proposed to promote the renewable generation and enhance energy efficiency their effectiveness in reducing environmental degradation and the promotion of decarbonization and discussing how developing countries do and should continue to invest in green

generation

energy global energy demand has more than doubled since 1970 the use of energy is strongly related to almost every conceivable aspect of development wealth health nutrition water infrastructure education and even life expectancy itself are strongly and significantly related to the consumption of energy per capita many development indicators are strongly related to per capita energy consumption fossil fuel is the most conventional source of energy but also increases greenhouse gas emissions the economic development of many countries has come at the cost of the environment however it should not be presumed that a reconciliation of the two is not possible the nexus concept is the interconnection between the resource energy water food land and climate such interconnections enable us to address trade offs and seek synergies among them energy water food land and climate are essential resources of our natural environment and support our quality of life competition between these resources is increasing globally and is exacerbated by climate change improving resilience and securing resource availability would require improving resource efficiency many policies and programs are announced nationally and internationally for replacing the conventional mode and also emphasizing on conservation of fossil fuels and reuse of exhausted energy so a gap in implications

and outcomes can be broadly traced by comparing the data this book aims to highlight problems and solutions related to conventional energy utilization formation and multitudes of ecological impacts and tools for the conservation of fossil fuels the book also discusses modern energy services as one of the sustainable development goals and how the pressure on resource energy disturbs the natural flows the recent advances in alternative energy sources and their possible future growth are discussed and on how conventional energy leads to greenhouse gas formation which reduces energy use efficiency the different policies and models operating is also addressed and the gaps that remained between them climate change poses a challenge for renewable energy and thus it is essential to identify the factors that would reduce the possibility of relying on sustainable energy sources this book will be of interest to researchers and stakeholders students industries ngos and governmental agencies directly or indirectly associated with energy research
