marlitt erbe provides a detailed introduction into the young research field of magnetic particle imaging mpi and field free line ffl imaging in particular she derives a mathematical description of magnetic field generation for ffl imaging in mpi to substantiate the simulation studies on magnetic ffl generation with a proof of concept the author introduces the ffl field demonstrator which provides the world s first experimentally generated rotated and translated magnetic ffl field complying with the requirements for ffl reconstruction furthermore she proposes a scanner design of considerably enhanced magnetic field quality and efficiency the author discusses the influence of magnetic field quality optimization on the image quality achieved using efficient radon based reconstruction methods which arise for a line detection scheme and based on this optimized design presents a dynamic ffl scanner assembly

the electric utility industry and its stakeholders in the united states appear to be at a critical juncture in time powerful forces of global proportions are propelling the industry instinctively and in a secular fashion towards restructuring that the industry will change is a fait accompli the nature and timing of the change is still a matter of intense debate however because of the evolution of the industry into its present day form i.e. regulated local monopolies in their designated franchise service territories the relative roles and expectations of various institutions would have to change to conform to the new state in the future in either encouraging or allowing this change to happen society is essentially saying that future societal welfare would be better served by the changed structure contemplated what that assumption translates into in more direct terms is that creation of future wealth would be better accomplished through redistribution of wealth today thoughtful individuals recognize the enormous responsibility placed upon the various entities empowered with jurisdiction over the timing and nature

in recent years 3d geo information has become an important research area due to the increased complexity of tasks in many geo scientific applications such as sustainable urban planning and development civil engineering risk and disaster management and environmental monitoring moreover a paradigm of cross application merging and integrating of 3d data is observed the problems and challenges facing today s 3d software generally application oriented focus almost exclusively on 3d data transportability issues the ability to use data originally developed in one modelling visualisation system in other and vice versa tools for elaborated 3d analysis simulation and prediction are either missing or when available dedicated to specific tasks in order to respond to this increased demand a new type of system has to be developed a fully developed 3d geo information system should be able to manage 3d geometry and topology to integrate 3d geometry and thematic information to analyze both spatial and topological relationships and to present the data in a suitable form in addition to the

simple geometry types like point line and polygon a large variety of parametric representations freeform curves and surfaces or sweep shapes have to be supported approaches for seamless conversion between 3d raster and 3d vector representations should be available they should allow analysis of a representation most suitable for a specific application

why are the many highly capable autonomous robots that have been promised for novel applications driven by society industry and research not available day despite the tremendous progress in robotics science and systems achieved during the last decades unfortunately steady improvements in specific robot abilities and robot hardware have not been matched by corresponding robot performance in real world environments this is mainly due to the lack of advancements in robot software that master the development of robotic systems of ever increasing complexity in addition fundamental open problems are still awaiting sound answers while the development of new robotics applications suffers from the lack of widely used tools libraries and algorithms that are redesigned in a modular and performant manner with standardized interfaces simulation environments are playing a major role not only in reducing development time and cost e.g. by systematic software or hardware in the loop testing of robot performance but also in exploring new types of robots and applications however their use may still be regarded with skepticism seamless migration of code using robot simulators to real world systems is still a rare circumstance due to the complexity of robot world sensor and actuator modeling these challenges drive the quest for the next generation of methodologies and tools for robot development the objective of the international conference on simulation modeling and programming for autonomous robots simpar is to offer a unique forum for these topics and to bring together researchers from academia and industry to identify and solve the key issues necessary to ease the development of increasingly complex robot software

black box web application vulnerability scanners are automated tools that are used to crawl a web application to look for vulnerabilities these tools are often used in one of two ways in the first approach scanners are used as point and shoot tools where a scanner is only given the root url of an application and asked to scan the site whereas in the second approach scanners are first configured to maximize the crawling coverage and vulnerability detection accuracy although the performance of leading commercial scanners has been thoroughly studied very little research has been done to evaluate open source scanners this paper presents a feature and performance evaluation of five open source scanners we analyze the crawling coverage vulnerability detection accuracy scanning speed reporting and usability features the scanners are tested against two well known benchmarks wivnet and wavsep additionally the scanners are tested against a realistic web application called wackopicko the chosen benchmarks are composed of a wide range of vulnerabilities and crawling challenges each scanner is tested in two modes default and configured lastly the scanners are compared with the state of the art commercial scanner burp suite professional our results show that being able to properly crawl a web application is a critical task in detecting vulnerabilities unfortunately the majority of the scanners evaluated had difficulty crawling through common web technologies such as dynamically generated javascript content and flash applications we also identified several classes of vulnerabilities that are not being detected by the scanners furthermore our results show that scanners displayed considerable improvement when run in configured mode
